1. General Information

- Name of the consortium: NFDI4Objects – Research Data Infrastructure for the Material Remains of Human History
- Research domains or research methods addressed by the consortium: NFDI4Objects defines its scope through object-based research on material remains of past human activity, anchored in Ancient Studies (RB 1.11) and spanning anthropology, bio- and environmental sciences, geosciences, geography, and architecture. It develops interoperable, FAIR RDM services tailored to the specific data structures and methodological requirements of this research domain.
- Review Board 1.11 Ancient Cultures, with relations to:
 - 1.16 Social and Cultural Anthropology, Non-European Cultures, Jewish Studies and Religious Studies
 - 2.11 Basic Research in Biology and Medicine
 - 2.12 Plant Sciences
 - 2.13 Zoology
 - 2.22 Medicine
 - 2.31 Agriculture, Forestry and Veterinary Medicine
 - 3.42 Geology and Palaeontology
 - 3.43 Geophysics and Geodesy
 - 3.44 Mineralogy, Petrology and Geochemistry
 - 3.45 Geography
 - 4.51 Construction Engineering and Architecture
- URL of the consortium website and repositories used for publishing output:
 - <https://www.nfdi4objects.net/>
 - <https://community.nfdi4objects.net/>
 - <https://zenodo.org/communities/nfdi4objects/>

2 Summary

NFDI4Objects (N4O) develops and operates a research data infrastructure for object-based research on material remains of past human activity. Its scope is anchored in Ancient Studies and extends across anthropology, bio- and environmental sciences, geosciences, geography, and architecture, integrating associated biological and environmental evidence. Their scientific value depends on contextualisation, comparison and long-term preservation. This requires shared standards, interoperable data models and reliable technical services capable of operating across disciplinary, institutional and federal boundaries.

The governance model combines formal decision-making structures with participatory formats such as Community Clusters (CCs), Temporary Working Groups (TWGs) and Task Related Activities for the Implementation and Launch of services (TRAILs) that translate Task Area objectives into operational, community-tested services. These formats enable the object-based research community to contribute directly to the development of standards and services, ensuring disciplinary relevance and institutional anchoring.

A central scientific contribution of N4O is the further development of shared metadata standards and ontologies for object-based data. At the core of this work lies the concept of the “object biography”, an event-based reference model that connects heterogeneous information about an object – including provenance, excavation context, analytical results, conservation history and collection trajectories – within a coherent semantic framework. Building on established standards N4O develops domain-specific minimal metadata sets, crosswalk ontologies and an Objects Core Metadata Profile. These components are designed for reuse beyond the consortium and have been published with persistent identifiers to ensure transparency and citability.

The technical backbone supporting these standards is now in productive operation. It includes a Knowledge Graph that integrates RDF- and LIDO-based data via standardised ingestion workflows, as well as authority data management services for publishing and mapping controlled vocabularies. Together, these components enable semantically interoperable data exchange across heterogeneous systems. The architecture is based on open standards and widely used open-source technologies and is aligned with NFDI basic services such as persistent identifier infrastructures and identity and access management.

Around this backbone, N4O is consolidating a FAIRification ecosystem that supports data management across the research data lifecycle. The service portfolio includes established tools for data capture, data collection management, data discovery and enrichment and long-term

Deutsche Forschungsgemeinschaft

www.dfg.de

archiving. Uptake indicators show growing acceptance within the community, and a structured service portfolio management framework has been introduced to support monitoring, quality assurance and sustainability.

An important structural development was the deliberate strengthening of technical coordination within the NFDI. As coordination structures across the NFDI matured, including through Base4NFDI, N4O established a Technical Unit to ensure that technical developments across all Task Areas are coherent and strategically aligned. By closely linking service planning with overall architectural design, the consortium clarified responsibilities, improved internal coherence, and facilitated collaboration with other NFDI consortia.

N4O contributes actively to the development of the NFDI as a whole. It participates in crossconsortial working groups on metadata, ontology harmonisation, research software engineering and terminology services. Through collaborations within Humanities@NFDI and the BioData Interest Group, object-based standards are aligned with those of other humanities and life science consortia. Standards and workflows developed in N4O are being implemented in large collaborative research projects and federal state initiatives, demonstrating transfer into broader research and cultural heritage infrastructures.

Internationally, N4O has intensified cooperation with major research infrastructures and domainspecific data services in its respective fields. Its graph-based architecture and metadata profiles are designed for interoperability with both relational and semantic infrastructures, facilitating structured data exchange beyond national contexts. Standards and specifications developed within N4O are referenced in international alignment processes and are being adopted in collaborative projects involving multinational partners. Through these activities, N4O strengthens the integration of object-based research data into emerging European data ecosystems and contributes to the practical harmonisation of semantic models and authority data frameworks.

Overall, NFDI4Objects has established a research-focused and community-driven infrastructure for object-based research data in Germany. It has translated conceptual objectives into operational standards and services, strengthened interoperability across disciplines and institutions, and demonstrated measurable uptake. The next phase will focus on consolidating service maturity, reinforcing sustainability mechanisms and further integrating national and international developments in research data infrastructures.
